Introduction

Sudoku is a globally popular number puzzle that relies on logical reasoning rather than mathematical skills. The objective is to fill a 9x9 grid so that each row, each column, and each 3x3 sub-grid contain the numbers from 1 to 9 exactly once. Sudoku puzzles vary in difficulty, with some requiring complex logical deductions to solve.

This project presents a **Sudoku Solver** written in Python that automatically solves Sudoku puzzles using a **backtracking algorithm**. The solver can take an incomplete Sudoku board as input and produce a complete, valid solution.

The **importance of Sudoku solving** extends beyond entertainment. It plays a role in AI development, combinatorial optimization, and constraint satisfaction problems in computer science. The backtracking approach used in this project is a powerful method for solving constraint-based problems efficiently.

In the next sections, we will discuss the **methodology** behind this solver, explore the algorithm, and demonstrate how it works with an example Sudoku puzzle.

Methodology

Approach Used to Solve the Problem

The **Sudoku Solver** uses a backtracking algorithm, which is a recursive approach to solving constraint satisfaction problems. The methodology is broken down into the following steps:

1. **Representation of the Sudoku Board:**
 - The board is represented as a 9x9 matrix (list of lists in Python).
 - Empty cells are represented by the number **0**.
2. **Validation of Moves:**
 - A helper function `is_valid(board, row, col, num)` is used to check whether placing a given number in a specific cell is valid.
 - The function ensures that:
 - The number does not already exist in the **same row**.
 - The number does not already exist in the **same column**.
 - The number does not exist in the **3x3 sub-grid**.
3. **Backtracking Algorithm:**
 - The `solve_sudoku(board)` function is called to find an empty cell.
 - It tries placing numbers from **1 to 9** in that cell.
 - If a number is valid, it is placed temporarily, and the function is called recursively to solve the rest of the board.
 - If no valid number can be placed, the function **backtracks** by removing the last placed number and trying the next one.
 - The process continues until the board is completely filled.
4. **Efficiency Considerations:**
 - Backtracking is a brute-force approach, but since Sudoku has a structured set of constraints, it performs efficiently for most standard puzzles.
 - Optimizations like **constraint propagation** and **naked pairs/triples techniques** can enhance performance for more complex puzzles.

This methodology ensures that any valid Sudoku puzzle can be solved efficiently using Python.

Code

```
# Function to check if placing a number in the given cell is valid according to Sudoku rules
def is_valid(board, row, col, num):
```

```
    # Check if the number is already present in the current row or column
```

```
    for i in range(9):
```

```
        if board[row][i] == num or board[i][col] == num:
```

```
            return False # If found, return False
```

```
    # Check the 3x3 grid (sub-grid) where the cell is located
```

```
    start_row, start_col = 3 * (row // 3), 3 * (col // 3)
```

```
    for i in range(3):
```

```
        for j in range(3):
```

```
            if board[start_row + i][start_col + j] == num:
```

```
                return False # If the number is found in the 3x3 sub-grid, return False
```

```
    return True # If no conflicts found, return True
```

```
# Function to solve the Sudoku puzzle using backtracking
```

```
def solve_sudoku(board):
```

```
    # Iterate through each cell in the 9x9 grid
```

```
    for row in range(9):
```

```
        for col in range(9):
```

```
            # Check if the current cell is empty (0 means empty)
```

```
            if board[row][col] == 0:
```

```
                # Try numbers from 1 to 9 for the empty cell
```

```
                for num in range(1, 10):
```

```
                    # If the number is valid for the current cell, place it
```

```
                    if is_valid(board, row, col, num):
```

```
                        board[row][col] = num
```

```
                    # Recursively attempt to solve the rest of the board
```

```
                    if solve_sudoku(board):
```

```
                        return True # If the puzzle is solved, return True
```

```
                    # If placing num didn't work, reset the cell and try the next number
```

```
                    board[row][col] = 0
```

```
                return False # If no number works for this cell, return False (backtrack)
```

```
    return True # If all cells are filled, the puzzle is solved
```

```
# Function to print the Sudoku board in a readable format
```

```
def print_board(board):
```

```
    # Print each row of the board, replacing 0 (empty cells) with '.'
```

```
    for row in board:
```

```
        print(" ".join(str(num) if num != 0 else '.' for num in row))
```

```
# Example Sudoku Board (0 represents empty cells)
```

```
sudoku_board = [  
    [5, 3, 0, 0, 7, 0, 0, 0, 0],  
    [6, 0, 0, 1, 9, 5, 0, 0, 0],  
    [0, 9, 8, 0, 0, 0, 0, 6, 0],  
    [8, 0, 0, 0, 6, 0, 0, 0, 3],  
    [4, 0, 0, 8, 0, 3, 0, 0, 1],  
    [7, 0, 0, 0, 2, 0, 0, 0, 6],  
    [0, 6, 0, 0, 0, 0, 2, 8, 0],  
    [0, 0, 0, 4, 1, 9, 0, 0, 5],  
    [0, 0, 0, 0, 8, 0, 0, 7, 9]  
]
```

```
# Print the original Sudoku board
```

```
print("Original Sudoku Board:")
```

```
print_board(sudoku_board)
```

```
# Attempt to solve the Sudoku puzzle
```

```
if solve_sudoku(sudoku_board):
```

```
    print("\nSolved Sudoku Board:")
```

```
    print_board(sudoku_board) # If solved, print the solved board
```

```
else:
```

```
    print("\nNo solution exists!") # If no solution is found, print an error message
```

Output/Result

Original Sudoku Board:

5	3	.	.	7
6	.	.	1	9	5	.	.	.
.	9	8	6	.
8	.	.	.	6	.	.	.	3
4	.	.	8	.	3	.	.	1
7	.	.	.	2	.	.	.	6
.	6	2	8	.
.	.	.	4	1	9	.	.	5
.	.	.	.	8	.	.	7	9

Solved Sudoku Board:

5	3	4	6	7	8	9	1	2
6	7	2	1	9	5	3	4	8
1	9	8	3	4	2	5	6	7
8	5	9	7	6	1	4	2	3
4	2	6	8	5	3	7	9	1
7	1	3	9	2	4	8	5	6
9	6	1	5	3	7	2	8	4
2	8	7	4	1	9	6	3	5
3	4	5	2	8	6	1	7	9
